Autotransformer is a special type of transformer that consists of a single winding. This winding is used for both primary & secondary (High voltage & low voltage) sides. It is widely used for its variable output voltage function, lower cost & small size.

### Autotransformer - Its Types, Operation, Advantages and ...

An Auto Transformer is a transformer with only one winding wound on a laminated core. An auto transformer is similar to a two winding transformer but differ in the way the primary and secondary winding are interrelated. A part of the winding is common to both primary and secondary sides. On load condition, a part of the load current is obtained directly from the supply and the remaining part is obtained by transformer action.

As, we are going to design a practical transformer so we must consider the core available in market. The standard Bobbins available in market practically is 1"x1", 1.25"x1.5", 1.5"x1.5" and so on. We took nearest core area available to our calculation. We took bobbin of 2.25 inch<sup>2</sup> (1.5"x1.5") or 0.00145161 m<sup>2</sup>.
