States S1, S2, S3, and S4 are the sleeping states. A system in one of these states is not performing any computational tasks and appears to be off. Unlike a system in the shutdown state (S5), however, a sleeping system retains memory state, either in RAM or on disk, as specified for each power state below in System hardware context sections. The operating system need not be rebooted to return the computer to the working state.

This is the first stage of the dissolution and known as S1 Stage. In S1 stage dissolved amount of each unit should not be less than Q+5%. It shows that every unit should be above 5% of the specified limit in the individual monograph. If any of the units is found below this limit then we have to analyze the sample in the S2 stage.

Tablet Dissolution Test in Different Stages (S1, S2 and S3 ...

S1: Continuous duty: The motor works at a constant load for enough time to reach temperature equilibrium. S2: Short-time duty: The motor works at a constant load, but not long enough to reach temperature equilibrium. The rest periods are long enough for the motor to reach ambient temperature. S3: Intermittent periodic duty

S2 Standby: System appears off. The CPU has no power; RAM is refreshed; the system is in a lower power mode than S1. It is not commonly implemented. S3 (STR) Standby: In this state, the CPU has no power, the power supply is in a reduced power mode, main memory (RAM) is still powered, although it is almost the only component that is. Since the state of the operating system and all applications, open documents, etc. lies all in main memory, the user can resume work exactly where they left off ...

Difference between S1 (POS) and S3 (STR) standby mode in BIOS?

Systems that support Modern Standby do not use S1-S3. Sleep: S1 S2 S3: The system appears to be off. Power consumed in these states (S1-S3) is less than S0 and more than S4; S3 consumes less power than S2, and S2 consumes less power than S1. Systems typically support one of these three states, not all three.
