Sixty-four nursing homes in Maryland failed to take sufficient infection control measures to protect residents from the coronavirus, according to state inspection records provided to The Baltimore Sun.

The Centers for Disease Control and Prevention sent three planning documents to officials in all 50 states as well as five large cities - Chicago, Houston, New York, Philadelphia and San Antonio - urging them to take action.

The politics and ethics of hospital infection prevention ...tion to minimise the risk for patients and staff of acquiring such infections is important that effective prevention and control measures are implemented.

Nurse's perceptions on infection prevention and control in ...nurse's role is integral in patient care, and it is important that nurses are aware of the impact of infection control policies on patient safety and quality of care.

Aims: This cross-sectional study was conducted to assess the awareness, perception, and attitude towards infection prevention and control among Jordanian dentists. The study aimed to provide an insight into the level of awareness, perception, and attitude towards infection control among Jordanian dentists, and to identify any potential barriers to effective infection control practices.

Methods: A survey was administered to Jordanian dentists in public and private dental clinics. The questionnaire included 20 questions, covering demographic information, awareness, perception, and attitude towards infection control. The data were collected and analyzed using the Statistical Package for Social Sciences (SPSS) software.

Results: A total of 100 dentists participated in the study, with a response rate of 92%. The results showed that 80% of the dentists had adequate knowledge of infection control measures, and 75% had a positive perception towards infection control. However, only 60% felt comfortable implementing infection control measures in their daily practice.

Discussion: The findings highlight the importance of continuing education and training for dental professionals to improve their knowledge and attitude towards infection control. The implementation of effective infection control policies, guidelines, and protocols is critical to prevent the spread of infections and improve patient safety.

Conclusion: The study concluded that Jordanian dentists have an adequate level of awareness and perception towards infection control, but there is a need for improved knowledge and attitude to implement effective infection control practices in their daily practice. Further research is recommended to identify potential barriers and develop strategies to improve the implementation of infection control measures.
