This can be done through a package known as Snort. Snort is a real-time packet sniffer, packet logger and a network intrusion detection system. On Ubuntu, installing snort is easy via command line: `sudo apt-get install snort -y`. The snort configuration files are located in `/etc/snort/snort.conf`. To test if the configuration files are working properly, type the following command: `sudo snort -T -c /etc/snort/snort.conf -i <interface>` Snort Rules

Snort can be deployed inline to stop these packets, as well. Snort has three primary uses: As a packet sniffer like tcpdump, as a packet logger — which is useful for network traffic debugging, or it can be used as a full-blown network intrusion prevention system. Snort can be downloaded and configured for personal and business use alike.

This article is excerpted from the new book Intrusion Detection with Snort by Jack Koziol. Real-time alerting is a feature of an intrusion detection system (IDS) or any other monitoring application that notifies a person of an event in an acceptably short amount of time. The amount of time that is acceptable is different for every person.
