OPEN-CHANNEL FLOW 1. INTRODUCTION 1 Open-channel flows are those that are not entirely included within rigid boundaries; a part of the flow is in contact with nothing at all, just empty space (Figure 5-1). The surface of the flow thus formed is called a free surface, because that flow boundary is freely deformable, in contrast to the solid

Open Channel Flow The Manning Equation is the most commonly used equation to analyze open channel flows. The Manning Equation is utilized in our open channel design calculations - Design of Circular Culverts, Design of Rectangular Channels, and Design of Trapezoidal Channels. It is a semi-empirical equation for simulating water flows in channels and culverts where the water is open to the atmosphere, i.e. not flowing under pressure, and was first presented in 1889 by Robert Manning.
