Use Of Coronary Angiography CT
CT coronary angiograms are used to diagnose a variety of heart conditions. A coronary CT angiogram is different from a standard coronary angiogram. In the traditional procedure (non-CT angiogram), a flexible tube (catheter) is threaded through your groin or arm to your heart or coronary arteries. If you have known coronary artery disease, your doctor might recommend the traditional approach because you can also receive treatment during the procedure.

CT coronary angiogram - Mayo Clinic
Coronary computed tomography angiography (CCTA) is a heart scan or imaging test that helps diagnose plaque buildup and consequent narrowing of the coronary arteries (the blood vessels that supply the heart). During a CCTA scan, you may receive an intravenous (IV) injection of contrast material as an intravenous (IV) injection to ensure the best possible images of the coronary blood vessels.

How is a CT Coronary Angiography Done?
Coronary CT angiography is the use of computed tomography angiography to assess the coronary arteries of the heart. The subject receives an intravenous injection of radiotracer and then the heart is scanned using a high speed CT scanner, allowing physicians to assess the extent of occlusion in the coronary arteries, usually in order to diagnose coronary artery disease. CTAs is superior to coronary CT calcium score in determining the risk of Major Adverse Cardiac Events. Coronary CT angiography - Wikipedia
A computerized tomography (CT) coronary angiogram is an imaging test that looks at the arteries that supply blood to your heart. It might be done to diagnose the cause of chest pain or other symptoms. A CT coronary angiogram uses a powerful X-ray machine to produce images of your heart and its blood vessels.

 Coronary Angiography: Preparation, Procedure, and Results
Coronary computed tomography angiography (CCTA) is a heart scan or imaging test that helps determine if plaque buildup has narrowed or blocked the coronary arteries, the blood vessels that supply the heart. Plaque is made of various substances such as fat, cholesterol and calcium that build up along the inner lining of the arteries.

 Coronary Computed Tomography Angiography (CCTA)
Coronary computed tomography angiography (CCTA) is a heart scan or imaging test that helps determine if plaque buildup has narrowed or blocked the coronary arteries. The procedure is performed to diagnose many heart conditions, including coronary artery disease (CAD), narrowing of the existing stent, and evaluation of coronary bypass graft patency.
